

**AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

1-5. Cancelled.

6. (Previously Presented) A network terminating unit for receiving digital data via a communications link comprising a signaling channel and at least one data channels, said signaling channel being operable to establish and control connections between said network terminating unit and one or more data sources via said communications link that data can be transferred from the data source to the network terminating unit via at least one data channel, the network terminating unit comprising:

a processor arranged to detect messages transmitted on the signaling channel that contain at least partial data of a predetermined type, the detected messages comprising sufficient information to enable the network terminating unit to establish how parts of data of the same predetermined type sent in separate messages are linked to enable the network terminating unit to reconstitute the data;

means arranged to extract the at least partial data; and

means arranged to store the at least partial data for passing to a first destination device;

wherein the network terminating unit is arranged to establish how partial data detected in separate signaling messages are linked and to reconstitute the data from said plurality of signaling messages.

7. (Previously Presented) A network terminating unit as in claim 6 wherein said at least partial data is reconstituted prior to being passed to a first destination device.

8. (Currently Amended) A network terminating unit as in claim 6 further comprising:

means operable to send at least partial data received ~~fr~~from the destination device to further destination devices using messages transmitted on the signaling channel.

9. (Previously Presented) A network terminating unit as in claim 6 in which the communications link is provided via Integrated Services Digital Network equipment.

10. (Previously Presented) A network terminating unit as in claim 6 in which said at least partial data is at least part of an e-mail or other textual message.

11. (Previously Presented) A network terminating unit as in claim 6 in which said predetermined type of said at least partial data comprises at least one of the group consisting of: a software download data, database search results, news information or telemetry data.

12. (Previously Presented) A network terminating unit as in claim 6 further comprising:

means operable to detect whether the destination device is active so as to be able to receive the data and, if said device is active, to transmit the data stored by the network terminating unit to the device.

13. (Previously Presented) A network terminating unit as in claim 6 further comprising:

means operable to receive data from the destination device and to package the data in one or more signaling messages for transmitting the data to a further destination device.

14. (Previously Presented) A network terminating unit as in claim 6 further comprising:

means operable to detect signaling messages indicating the set up of a connection to a predetermined destination device and in response to such detection to transmit the data stored by the network terminating unit to the predetermined destination device.

15. (Currently Amended) A network terminating unit as in claim 6 further comprising:

means operable to monitor the activity of the signaling channel and to send  
~~and/or~~and receive the data of a predetermined type when the signaling channel activity is  
within a predetermined range.

16. (Currently Amended) A network terminating unit as in claim 6 further  
comprising:

means operable to send ~~and/or~~and receive the data of a predetermined type during  
a predetermined time interval.

17. (Previously Presented) A network terminating unit as in claim 6 further  
comprising:

means operable to estimate the time for transmitting data to a destination via the  
signaling channel and, if the time exceeds a predetermined threshold, to transmit the data  
to the destination using one or more of the data channels.

18. (Previously Presented) A network terminating unit as in claim 9 further  
comprising means operable to:

a) firstly establish the number of messages to be transmitted to a destination  
device and transmitting data representing said number;

b) secondly identify the sender of each message to be transmitted to the  
destination device and transmitting data representing each said sender; and

c)      thirdly transmit data representing the text of each message to the destination device.

19.      (Previously Presented) A method of operating a network terminating unit for receiving digital data via a communications link comprising a signaling channel and at least one data channel, said signaling channel being operable to establish and control connections between said network terminating unit and one or more data sources via said communications link so that data can be transferred from a data source to the network terminating unit via at least one data channel, the method of operating the network terminating unit comprising:

detecting messages transmitted on the signaling channel that contain at least partial data of a predetermined type, the detected messages further containing sufficient information to enable the network terminating unit to establish how parts of data of the same predetermined type sent in separate messages are linked to enable the network terminating unit to reconstitute the data;

extracting the at least partial data;

establishing how partial data detected in separate signaling messages are linked;

reconstituting the data from said plurality of signaling messages; and

storing the at least partial data for passing to a destination device.

20. (Previously Presented) A method as in claim 19 wherein said step of reconstituting the data occurs prior to passing the data to a destination device.

21. (Previously Presented) A method as in claim 19 wherein the communications link comprises an Integrated Service Digital Network communications link, and said signaling channel is a D channel of an Integrated Service Digital Network communications link.

22. (Previously Presented) A method as in claim 19 wherein the at least partial data of a predetermined type comprises at least part of at least one e-mail or other textual message, and wherein in said step of reconstituting said digital data into a whole form, the whole of said at least one textual message is reconstituted.

23. (Previously Presented) A method as in claim 19 wherein the data of a predetermined type comprises at least part of a software download, data base search results, news information or telemetry data, and wherein in said step of reconstituting said digital data into a whole form, the whole of said software download, database search results, news information or telemetry data is reconstituted.

24. (Previously Presented) A method as in claim 19 further comprising detecting whether the destination device is active so as to be able to receive the reconstituted data and, if said device is active, to transmit the data stored by the network terminating unit to the device.

25. (Previously Presented) A method as in claim 19 further comprising receiving data from the destination device and packaging the data into one or more signaling messages for transmitting to a further destination device.

26. (Previously Presented) A method as in claim 19 further comprising detecting signaling messages indicating the set up of a connection to a predetermined destination device; and, in response to such detection

transferring the data stored by the network terminating unit to the predetermined destination device.

27. (Previously Presented) A method as in claim 19 further comprising:  
  
monitoring the activity of the signaling channel; and  
  
transferring the data of a predetermined type when the signaling channel activity is within a predetermined range.

28. (Previously Presented) A method as in claim 19 further comprising transferring the data of a predetermined type during a predetermined time interval.

29. (Previously Presented) A method as in claim 19 further comprising:  
  
estimating the time for transmitting data to a destination via the signaling channel;  
  
and, if the time exceeds a predetermined threshold,

transferring the data to the destination using one or more of the data channels.

30. (Previously Presented) A method as in claim 21 further comprising:

- a) firstly establishing the number of messages to be transmitted to a destination device and transferring data representing said number to the network terminating unit;
- b) secondly identifying the sender of each message to be transmitted to the destination device and transferring data representing each said sender to the network terminating unit; and
- c) thirdly transferring data representing the text of each message to the network terminating unit.
